Vantage-Point: Codebase Summary

Source: graphify run on `vp-006-local-dev-startup-f89` (09fbc70) — 139 files, 666 nodes, 1,385 edges, 31 communities. Main (`9e0561d`) differs only by VP-012/013 dependency/CI security patches and PR #11. Cohesion scores are low (0.05–0.19): clusters are file-structure driven, treat as a map, not proof of coupling.

1. Stack

Layer	What
Frontend	Next.js 16 / React 19 / TypeScript in `apps/web` (app/auth, app/dashboard, features/auth, features/receipts, components/ui, components/dashboard)
Backend	Go API + receipt worker in `services/backend` (`internal/foundation`, `internal/receipts`; `internal/banking` and `internal/dashboard` are empty)
Data	One Supabase/Postgres DB; 5 migrations: foundation profiles + 4 receipt drafts migrations. No banking schema yet
Auth	Supabase Google OAuth (PKCE), bearer-only; `GET /api/v1/me`; profile = canonical identity
Providers	Gemini 3.5 Flash-Lite behind a provider-neutral Extractor (ADR-008). Teller selected for Banking (VP-009..011, BACKLOG)
Tooling	pnpm monorepo, Python dev scripts (`scripts/`), GitHub Actions CI (Frontend/Backend/Database/Security)

2. Domains and ownership (AGENTS.md)

Agent	Owns	State
Foundation	Auth, profiles, identity, middleware, shared contracts	VP-002/003/004/006(M1) done
Dashboard	Shell, navigation, Settings skeleton, presentation	VP-005/007 merged
Receipts	Upload, OCR, items, draft split, receipts API/schema	VP-008 done (draft split only)
Banking	Teller/Plaid, connections, accounts, transactions, sync worker	Not started
Integration/Review	Independent approval; cross-domain FKs	Gate for everything

3. Key graph nodes

Most connected: `ReceiptWorkspace()` (frontend hub), AGENTS.md, DESIGN.md, VP-008 task, and the Go `Calculate()` money-split function. Cross-cutting rules that the graph links across every domain: integer minor-unit money; largest-remainder tax/tip distribution; provider adapter boundary; no frontend-trusted IDs; RLS keyed on `auth.uid()`.

4. Communities

#	Name	Nodes
0	Go backend core (identity, profiles)	90
1	Next.js pages and routes	86
2	Python dev tooling	59
3	Task and report docs	55
4	Go auth middleware	47
5	CI workflow	44

6	Receipts UI + shared UI	37
8	Receipt domain models	27
9	Dashboard shell	23
12/13	Auth/UI contracts; receipt money rules	14 each

5. Gaps and caveats

- Receipt finalization, participants, share links, receivables: not built (only draft split).
- 15 `.sql` files not parsed (tree-sitter-sql missing), so schema detail in the graph is thin.
- Docs were extracted by subagents (INFERRED edges possible); one PNG fixture skipped.
- Root checkout (`vp-001` branch) is stale; use main or worktrees.
